AUTHOR	Kaplan, Tom; And Others
TITLE	WisKids Count Data Book, 1997: A Portrait of Child Health in Wisconsin. Book 4.
INSTITUTION	Wisconsin Council on Children and Families Inc., Madison.; Wisconsin Univ., Madison. Inst. for Research on Poverty.
PUB DATE	Mar 97
NOTE	183p.
AVAILABLE FROM	Wisconsin Council on Children and Families, 16 North Carroll Street, Suite 420, Madison, WI 53703; phone: 608-284-0580; fax: 608-284-0583 (book or CD-ROM, $15).
PUB TYPE	Numerical/Quantitative Data (110) -- Reports - Descriptive (141)
EDRS PRICE	MF01/PC08 Plus Postage.
DESCRIPTORS	Academic Achievement; Adolescents; Birth Weight; Births to Single Women; Child Abuse; *Child Health; Child Welfare; *Children; Counties; Crime; Delinquency; Demography; Dropout Rate; Early Parenthood; *Economically Disadvantaged; Health Care Costs; Health Services; Infants; Mortality Rate; One Parent Family; Poverty; *Social Indicators; Socioeconomic Status; State Surveys; Statistical Surveys; Substance Abuse; Trend Analysis; Violence; *Well Being; Youth Problems
IDENTIFIERS	Arrests; Health Care Reform; *Indicators; Medicaid; Out of Home Care; *Wisconsin

ABSTRACT

This Kids Count data book examines statewide trends in the well-being of Wisconsin's children, focusing specifically on child health. The book provides a baseline on child health at the point of elimination of the Aid to Families with Dependent children program and the adoption of Wisconsin Works (W-2) program. The statistical portrait is based on nine general areas: (1) births; (2) county data; (3) public schools; (4) health care resources; (5) hospitals; (6) health conditions; (7) health care services; (8) Medicaid health care services; and (9) health care payment sources. Indicator one examines births to single and teenage mothers as well as prenatal care. Indicator two examines juvenile arrests, child care, out of home placements, and child abuse and neglect. Indicator three examines scholastic achievement, dropouts, and instructional costs. Indicator four examines availability of physicians. Indicator five examines healthcare facilities. Indicator six examines low birthweight, substance abuse, infant and child mortality, sexually transmitted diseases, divorce, immunization, and abortion. Indicator seven examines disadvantaged child programs and childhood hospitalizations. Indicator eight examines use of Medicaid. The final indicator examines preventable hospitalizations and healthcare funding. The report ends with summaries of child and health data by county, and county social and health indicators. (SD)

ABOUT THE COLLABORATORS

The Wisconsin Council on Children and Families, Inc., is a statewide, nonprofit organization which promotes the well-being of children and families in Wisconsin by advocating for effective and efficient health, education, and human service delivery systems that are accessible and equitable. The Council, governed by a 30 member board of directors from throughout the state, works cooperatively with the Children's Defense Fund and is a member of the National Association of Child Advocates. **The Council welcomes individuals and organizations as members.**

The Institute for Research on Poverty is a national, nonpartisan, university-based center for research into the causes and consequences of poverty in the United States. The Institute was established in 1966 at the University of Wisconsin-Madison by the U.S. Office of Economic Opportunity, the Organization given the responsibility for waging war on poverty at the national level. In the years since then, the Institute's multidisciplinary affiliates have formulated and tested basic theories of poverty and inequality, developed and evaluated social policy alternatives, and analyzed trends in poverty.

The Robert M. La Follette Institute of Public Affairs offers a Master of Arts Degree in Public Policy and Administration. Faculty members also conduct research on a wide range of policy areas, both as faculty-initiated research efforts and in response to the requests of Wisconsin state agency and legislative officials. The Institute reaches out to the policy community and the public by offering legislative seminars, public lectures, and staff colloquia, and by holding conferences and training workshops.

KEEPING THE VISION FOR WISCONSIN CHILDREN

As we stand on the threshold of the next century, Wisconsin has the knowledge and the tools to save children's lives and ensure their physical and mental health. We know that healthy children need safe homes and neighborhoods, access to nutritious food, a clean environment, quality child care and health care. While many systems are being strained to meet the needs of all our children, rapidly rising medical costs and reduced access to full health care coverage has put health care for many children at risk. There is a widening gap between those who can take advantage of medical services and those who have difficulty getting even basic care. Our vision for Wisconsin's children includes full health insurance coverage that meets the needs of all children.

Pregnant women and children need a basic level of care. To be born healthy and grow up healthy, children need a health care system that is cost-effective, comprehensive, and accessible. Accessibility will be a reality for many children and pregnant women only if the services are available in their neighborhoods and communities. Health professionals, working with professionals in other disciplines, can fashion "one-stop shopping" centers that integrate many health and social services in one location. They can craft programs that bring more services to schools and community centers.

Adequate nutrition, safe homes and neighborhoods, and healthy lifestyles–together with access to health care–can give all children a chance to realize their full potential. To that end, we believe:

Families are the first caregivers for their children. Families have the first responsibility to provide for the physical and mental health of their children. However, it has become more difficult for many low-income, working families to access health care as costs have risen. Given the new economic uncertainties of the workplace, some families require assistance in accessing good health care for their children and meeting basic needs.

Communities have a responsibility to provide for their children. Communities can create safe neighborhoods, develop community-based health education and health care programs, sponsor special projects to help families gain access to needed services. To strengthen the communities, employers must make a commitment to help in meeting children's basic health needs and to ensure that all families have access to health care.

Government can support children through public policies that guarantee a basic level of health care for all children and pregnant women. To ensure that all children have an equal chance to be successful, governments must balance the scales of health care access and basic needs for healthy development. Timely preventive and acute health care and safe living conditions are essential to all children's growth and development and to their future prospects.

THE KIDS COUNT STORY

In 1992, the Wisconsin Council on Children and Families was chosen by the Annie E. Casey Foundation to be the KIDS COUNT organization in Wisconsin. KIDS COUNT is a national and state-by-state effort to track the status of children. By providing policy makers and citizens with benchmarks of child well-being, KIDS COUNT seeks to enrich local, state, and national discussions concerning ways to secure better futures for all children. WisKids Count presents a more detailed, county-by-county picture of the condition of children in Wisconsin.

A publication of this size takes the combined efforts and resources of many people. We are grateful to the following for supporting the 1997 edition of WisKids Count:

Annie E. Casey Foundation
Helen Bader Foundation
Dean Foundation
Wisconsin Physician's Service
American Family Insurance
Kimberly-Clark
Maternal and Child Health Coalition
Children's Health Alliance
American Academy of Pediatrics – Wisconsin Chapter
Oscar Mayer Foods
Kohl Charities
State Medical Society

Additional funds have been designated to underwrite research costs in specific counties. The Council acknowledges the support of:

American Medical Society (Brown County)
Basic American Foods (Portage County)
First American Bank (Dunn County)
Gundersen Lutheran Children's Miracle Network (La Crosse County)
Janesville Foundation (Rock County)
Johnson Wax Fund (Racine County)
Northwestern Mutual Life Insurance Foundation (Milwaukee County)
Oshkosh Foundation (Winnebago County)
Fred J. Peterson Foundation (Door County)
Ziemann Foundation (Waukesha County)

WCCF gratefully acknowledges Adtec Lithographics for printing services and Adtec Data Technologies for their efforts in producing the CD-ROM version of the 1997 WisKids Count Data Book.

Introduction and Summary Points

BEST COPY AVAILABLE

INTRODUCTION

This is the fourth in a series of annual WisKids Count data books providing information on Wisconsin's children and the public programs that serve them. The first two editions presented data on the demographic characteristics of the child population and indicators of child well-being across several domains. The third book focused on public schools, presenting data by school districts as part of an effort to capture baseline statistics at the beginning of a period of major change in teacher compensation and educational finance (the state assumed two-thirds of school district costs beginning in 1995). This data book emphasizes child health in Wisconsin. The book provides a baseline on the status of child health at the start of another major change in state policy--the elimination of the Aid to Families with Dependent Children program and the adoption of Wisconsin Works, or W-2.

Determinants of child health extend well beyond the formal medical care system, encompassing factors such as home environment, community safety, and the availability of high-quality child care. This book includes, for each county, indicators like child abuse and neglect reports, juvenile arrests, and child care access, in addition to more traditional health indicators such as blood lead levels, hospital admissions owing to asthma, and childhood accident reports.

The remainder of this introduction describes potential health-related impacts of W-2, summarizes current health insurance coverage of children in Wisconsin, relates selected findings on aspects of maternal and child health in Wisconsin, describes findings on health care resources in Wisconsin, and finally discusses selected data on child health derived from sources outside the formal health care system.

10

THE IMPORTANCE OF WISCONSIN WORKS (W-2)

The nature and scope of public payment for the health care of low-income children in Wisconsin is unsettled as the state begins its implementation of W-2. As part of his initial W-2 proposal, Governor Tommy Thompson suggested replacing the Medicaid program, which provides health care coverage for low-income families with children, with a new W-2 health care program that would cover some low-income people not now covered by Medicaid, charge a monthly premium to W-2 health care program participants, and require participants with access to private insurance to rely on that source of coverage.

Implementation of this W-2 health care proposal would require either the conversion of the entire federal Medicaid program into block grants to the states or less sweeping changes in federal Medicaid law coupled with extensive federal waivers for Wisconsin. Such changes have not occurred. At least some of them remain a possibility, however, and even if the current Medicaid system continues, other provisions of W-2 are likely to influence child health status by affecting:

1. The number of poor and near-poor children. To the extent that W-2 increases or decreases the number of poor and near-poor children, the health status of children may also change. Low income is at least a predictor and possibly a cause of poor health among children.

2. Medicaid participation rates. Under W-2, families will not automatically become enrolled in Medicaid when they enroll in W-2, even if they meet eligibility criteria. Those who are eligible for Medicaid may have to apply at a location different from the W-2 application site, and this could affect Medicaid participation rates.

3. The timeliness of prenatal care. Under AFDC, women were eligible for Medicaid upon confirmation of pregnancy. This remains the case under W-2, but eligibility for an AFDC cash grant in the seventh month of pregnancy is eliminated. Pregnant women with no other children are ineligible for W-2 services until after their child is born, which may leave them less aware of their eligibility for Medicaid during pregnancy.

4. The Healthy Start program. Under W-2, pregnant women and children up to age 6 with an income below 185 percent of poverty continue to be eligible for Medicaid coverage through the state's Healthy Start program. However, both the new federal welfare legislation and the federal waiver process leave the door open for future change.

11

MEDICAID AND COMMERCIAL HEALTH INSURANCE COVERAGE OF CHILDREN IN WISCONSIN

In 1995, more than 245,000 children received their health care through Wisconsin's Medicaid program. All children receiving AFDC were automatically eligible for Medicaid. Children also qualified for Medicaid if they were disabled or their families had enough medical expenses to reduce family disposable income to qualifying levels. By July of that year, under the Wisconsin Healthy Start program, infants and children up to age six could qualify for Medicaid coverage if they were in families with incomes below 185 percent of the federal poverty line. Older children could also qualify if their family income was at or below the federal poverty line and if they were born after September 30, 1983.

Between 1990 and 1994, the number of Wisconsin children participating in Medicaid grew from 195,000 to 248,000, an increase of 27.6 percent. The increase was primarily due to policy decisions to increase Medicaid participation through the Healthy Start program. As shown in Figure 1, almost all the increases in participation by children in the Medicaid program occurred between 1990 and 1993, the key years of Healthy Start implementation. The increase in the child population on Medicaid in those years accounted for most of the total increase in Medicaid participation. After 1993, the large growth ended: the number of children in the Medicaid program actually declined by 1.1 percent between 1994 and 1995, and the decline that year in the number of children under age one in Medicaid was much sharper (4.9 percent).

Despite the recent decline in Medicaid participation among children, the Medicaid program is still a major source of health care coverage. As Table 1 indicates, fully one-third (36.6 percent) of all births in the state were covered by Medicaid in 1994, the most recent year for which data are available.

FIGURE 1

Number of Wisconsin Medicaid Participants, 1990-1995

TABLE 1

Wisconsin Births by Primary Source of Payment in 1994

Source of payment	Percentage
Medicaid	36.6
Commercial Insurance	56.6
Other Third Party	4.6
No Third Party and Other	2.3

Source: Center for Health Statistics, Wisconsin Department of Health and Family Services, "Maternal and Child Health Statistics–1994," Table 2.11.8.

Based on data from the Wisconsin Family Health Survey for 1994, it appears that many children continue to rely on the Medicaid program for health care access during the first four years of their life. According to the Survey, 29 percent of children ages one to four and 17 percent of children ages five to fourteen were enrolled in Medicaid at any given time.

As Table 2 indicates, the Family Health Survey also reports that 80 percent of all children in Wisconsin were covered by a commercial health plan in 1994. This percentage appears substantially higher than the national average of 62 percent, although the state and national figures are not directly comparable because they derive from different surveys using different methodologies. (The national figures are from the National Health Interview Survey, which does not report statistics for individual states.) Wisconsin's percentage of uninsured children also appears lower than the national average, as is the percentage of children who receive their health care through Medicaid. (However, Medicaid administrative data indicate that as many as 18 percent of Wisconsin children receive Medicaid at any time, compared to the 10 percent suggested in the Wisconsin Family Health Survey; with its dependence on a telephone survey strategy, that survey may undercount low-income people who would be more likely to participate in Medicaid.)

The Family Health Survey indicates that children covered by Medicaid are more likely to have had a general physical examination within the previous year than children covered by commercial insurance, although again the survey data differ from Medicaid administrative data, which are presented by county in this WisKids report and suggest a lower rate of preventive care. About 90,000 HealthCheck screens (the Medicaid term in Wisconsin for a full well-child physical examination) were performed on children from birth through age twenty in 1994, but only 42 percent of enrolled children were reported as receiving all appropriate HealthCheck and preventive services, compared to the federal target for the Wisconsin Medicaid program of 67 percent.

TABLE 2

Insurance Status of Children in Wisconsin and the United States Calendar Year 1994
(% of Children Ages 0-17)

Insurance Type	United States	Wisconsin
Commercial	62%	80%
Medicaid	24%	10%
Uninsured	14%	9%

Source: Wisconsin figures from Center for Health Statistics, Wisconsin Department of Health and Family Services, "The Uninsured and Insured in Wisconsin, 1994," Table 8A. United States figures from U.S. General Accounting Office, Health Insurance for Children: Private Insurance Coverage Continues to Deteriorate (Washington, D.C.: 1995), GAO/HEHS-96-129, 2.

A HealthCheck Screen Includes:

A comprehensive health and developmental history, including assessment of both physical and mental health development.

A comprehensive unclothed physical exam.

Hearing, vision, and dental assessments.

Appropriate immunizations according to age and health history.

Appropriate laboratory tests, including lead poisoning screening.

Health education, including anticipatory guidance.

If a HealthCheck screen detects any health conditions requiring treatment, the necessary referrals will be made for follow-up care.

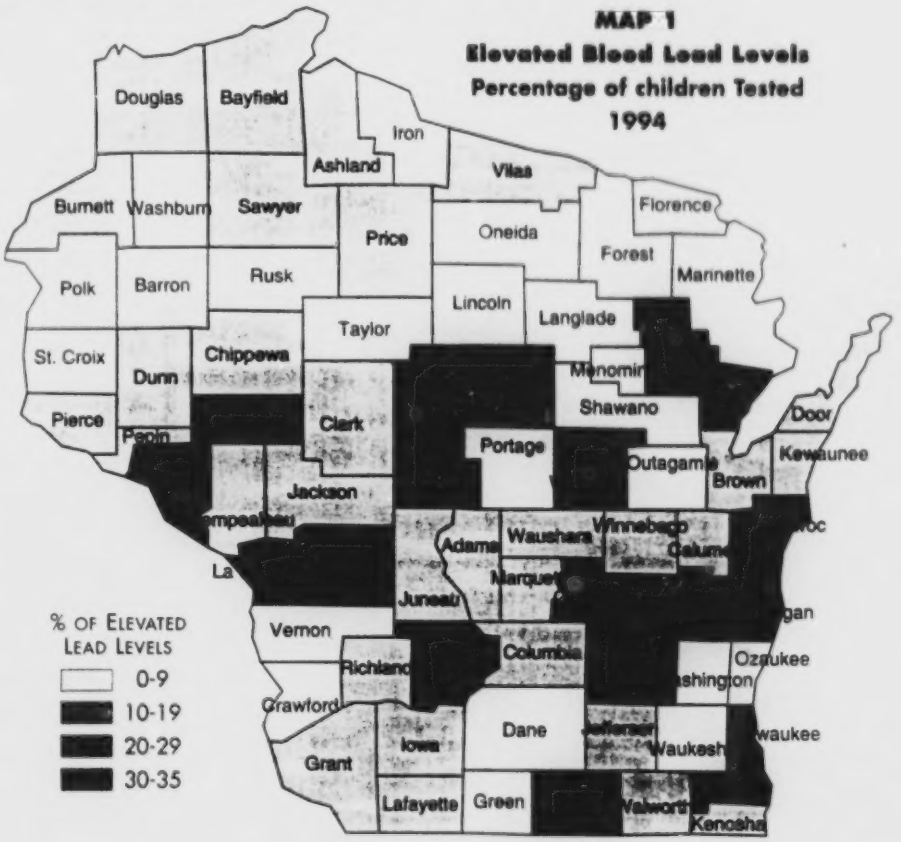
A. THE RELATIONSHIP BETWEEN INCOME AND REPORTED HEALTH

Most Wisconsin children (97 percent), based on parental responses to the 1994 Family Health Survey, are reported to be in good or excellent health. However, children in poverty are more likely to be reported to be in poor health. Eight percent of children in poverty who are ages one to four are reported to be in fair or poor health, compared to the 3 percent of all children. Similarly, 4 percent of children in "near-poor" households--those between 100 and 200 percent of the federal poverty line--were reported in fair or poor health, while only 2 percent of children in households with incomes at 200 percent of poverty or more were reported to have less than good health.[1]

B. LEAD POISONING

Lead poisoning in children, which can cause learning disabilities, behavioral difficulties, and damaged nerve systems, is largely a preventable public health problem requiring large-scale testing of the blood lead levels in young children, especially those living in older housing. For children with elevated levels of lead in the blood, public health workers can help identify the source—often leaded paint chips in windows, cribs, or carpeting. With advice and limited assistance, families can usually remove the source of contamination, allowing blood lead levels to fall in subsequent testing.

MAP 1
Elevated Blood Lead Levels
Percentage of children Tested
1994



Source: Unpublished data from the Bureau of Public Health, Wisconsin Department of Health and Family Services, 1996

Map 1 shows, by county, the percentage of children tested in 1994 whose blood contained elevated levels of lead. Children tested in Milwaukee, Racine, and Marathon Counties had the highest percentage of elevated lead levels, followed by children in several southeastern, western, and central counties. The map shows rates of elevated blood levels only among children who have been tested, not among all children in a county. A county that tests primarily in high-risk areas with older homes may show a higher percentage of tested children with elevated lead levels than does a county which tests a broader range of its child population, even if the actual level of lead poisoning is similar in the two counties. Because many of the worst effects of lead poisoning can be prevented, it is important for counties to vigorously promote lead testing and remediation programs.

C. BIRTHS IN WISCONSIN

The number of births in Wisconsin and the rate of births per women in childbearing years has been steadily declining, as Table 3 indicates. In the last few years, the teen birth rate has also been declining, after four years of increase that extended from 1988 through 1991.

By standard measures of newborn health (weight and the presence or absence of congenital anomalies), most children in Wisconsin are born healthy. Table 4 shows the percentage of newborns born at low birth weight (less than 5.5 pounds) and very low birth weight (less than 3.3 pounds) and the percentage with congenital anomalies by major racial/ethnic groups.

Table 3 **Total Births and Birth Rates, 1990-1994**

Year	Number of Births	Birth Rate Per 1000 Females Ages 15-44	Birth Rate Per 1000 Females Ages 15-19
1990	72,636	64.5	42.4
1991	72,039	63.4	43.8
1992	70,662	62.2	42.1
1993	69,760	61.4	41.0
1994	68,265	59.9	38.8

Source: Center for Health Statistics, Wisconsin Department of Health and Family Services, "Wisconsin Community Health Profiles: Children," September 1996, p. 2.

Table 4 **Percentage of Newborns with Low Birth Weight, Very Low Birth Weight, and Congenital Anomalies, by Race/Ethnicity of Mother, 1994**

% Births	White	Black	American Indian	Hispanic	Laotian/ Hmong	Total
Low Birth Weight (3.3-5.5 Pounds)	4.5	11.7	3.9	5.3	4.2	5.2
Very Low Birth Weight (<3.3 Pounds)	0.9	2.7	1.2	1.5	1.1	1.1
With Congenital Anomalies	1.3	0.8	1.3	1.1	1.5	1.2

Source: Center for Health Statistics, Wisconsin Department of Health and Family Services, Maternal and Child Health Statistics 1994," Table 2.1.8

Map 2 shows the distribution of low and very low weight births in the state's counties. Pockets of counties in the southeast, central, and northern parts of the state have had the highest rates; Milwaukee and Marquette Counties show the highest percentages. Map 3 shows the distribution of very low weight births in the state. Milwaukee, Adams, Buffalo, Langlade, Price, and Iron Counties had the highest percentages of such births (although in no county were more than 1.8 percent of all births in this category).

D. TEEN BIRTHS

Women who are pregnant as teenagers present special health care concerns. Pregnant teens in Wisconsin are more likely to smoke during pregnancy, delay or entirely omit prenatal care, and have babies with low birth weight. In 1994, as Table 5 indicates, 27 percent of Wisconsin teens ages 15-19 smoked during their pregnancies, compared to 15 percent of women ages 30 and above.

Statewide, as Table 6 shows, late or no prenatal care has been more prevalent among teens than among older women who give birth. Among pregnant teens, 7.7 percent failed to initiate prenatal care until the third trimester or received no prenatal care at all, compared to an average of 3.5 percent for all pregnant women. The consequences of the increased smoking and reduced prenatal care may be significant. As Table 6 shows, 9.3 percent of all births to teens had low birth weight, compared to under 7 percent for women ages 20 and over.

SELECTED HEALTH CARE RESOURCES FOR CHILDREN

Map 4 shows the distribution of psychologists who have indicated that at least part of their practice includes children. Map 5 shows the distribution, by county, of primary care physicians (family practice, internal medicine, pediatrics, obstetrics/gynecology, and psychiatry). Although many Wisconsin residents who live in border counties see medical providers in Minnesota, Illinois, and the upper peninsula of Michigan, the maps offer an indication of the distribution of health care personnel in Wisconsin. Dane and Ashland Counties contain the highest number of providers per 10,000 children; providers in both counties, of course, serve residents of other counties as well.

It is difficult to know how these resources translate into care on a county-by-county basis. Because most children are in good health, the special challenge in prenatal and pediatric care is not merely to treat illness or disability, but to prevent or reduce adverse effects on a child's overall development through early and continuous intervention. This kind of health care requires not only averting or treating acute illness, but also monitoring routine growth and development, counseling parents and pregnant women, and seeking to minimize potential developmental problems.[2]

MAP 4
Number of Psychologists per 10,000 Children 1993

BEST COPY AVAILABLE

For pregnant women, it is possible to monitor fairly closely the provision of routine preventive care, because the number of visits and the date of the first visit for prenatal care are noted on birth certificates. Map 6 shows the distribution of births in which prenatal care was either not provided until the third trimester of pregnancy or not provided at all. Menominee, Clark, Pepin and Vernon Counties contained the highest percentage of births with late or no prenatal care, followed by Milwaukee, Monroe, Waushara, Sawyer, Iron, and Forest Counties. In general, prenatal care was most likely to be late or not received in the northwestern and central parts of the state, and least likely to be late or not received in the east central (with the exception of Menominee County) and south central parts of the state.

These data should not necessarily be considered indicative of the quality of prenatal care providers in the areas in which late or no prenatal care was most and least likely. Pregnant women with insurance and higher educational levels are most likely to obtain early prenatal care, and these qualities are not randomly distributed throughout the state. But the data do suggest that particular counties and regions might benefit from special emphasis on routine, preventive prenatal care, and that these counties and regions bear special monitoring as W-2 is implemented.

For older children, it is much harder to determine whether appropriate monitoring, counseling, and preventive services are provided. No universally accepted indicator of health status equivalent to birth weight is available for older children, and visits for routine care are not captured in any data base in the way that prenatal care visits are available from birth certificates. Statewide surveys provide some indication of health status and services in the full state, but no information by county. The Wisconsin Family Health Survey reports that, for Wisconsin children ages 1-14, parents report that most children are in good health, 82 percent visited a doctor in the past year, and 71 percent received a general physical examination within the past year. For children ages 3-14, parents report that 84 percent visited a dentist in the past year, and for children ages 8-14, parents report that 49 percent had sealants placed on their teeth.[3] Again, these statewide percentages bear monitoring as W-2 is implemented.

Although these are generally high percentages, the surveys also show that 29 percent of children have not had a physical and 16 percent had not visited a dentist in the last year. The statewide surveys do not reliably indicate where in the state these children without a physical or dental visit in the last year resided. However, limited inferences about access to primary care, by county, can be drawn from data on hospitalizations for certain conditions sensitive to ambulatory care. Conditions such as severe ear/nose/throat infections, bacterial pneumonia, asthma, diabetes, and anemia are generally considered to be treatable outside of hospitals with good primary care. Higher rates of hospitalization for these conditions may indicate areas of the state in which primary care resources for children may need special attention. Asthma is the most prevalent chronic childhood condition that may result in preventable hospitalization. Map 7 indicates that Milwaukee, Menominee, and Chippewa Counties had the highest rate of childhood asthma hospitalizations, followed by Jackson, Monroe, Grant and Kenosha Counties.

Again, the higher rates of hospitalizations for asthma in these counties do not necessarily reflect the quality of local medical providers, because socioeconomic conditions play a key role in health care utilization. The counties do, however, bear special observation as W-2 is implemented.

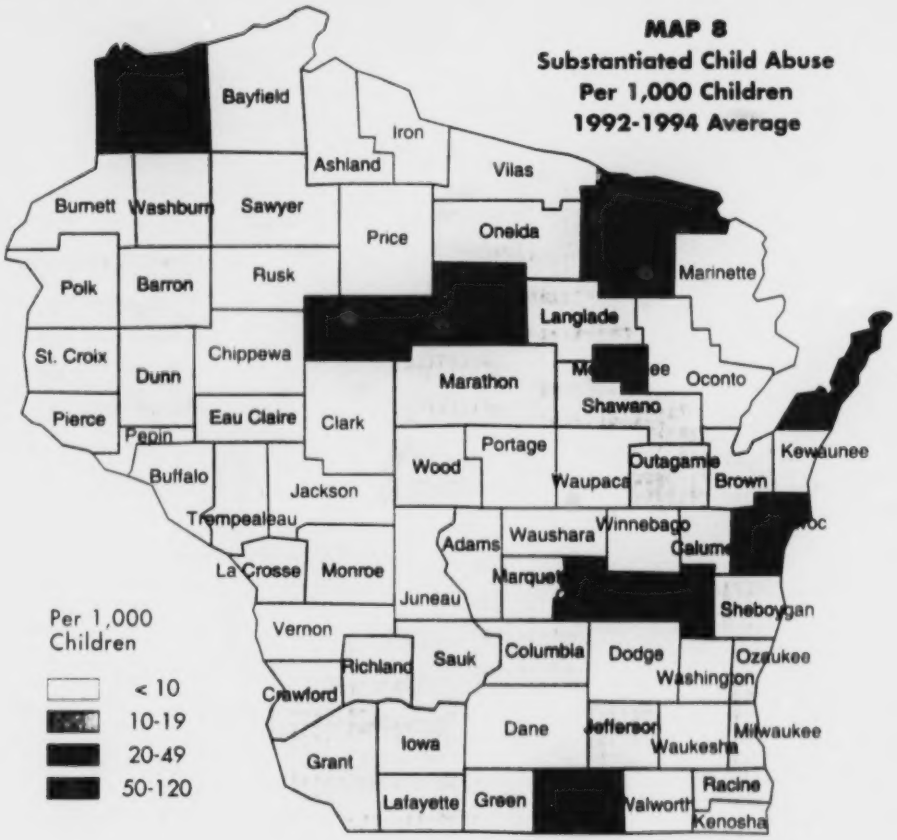
Child health and child well-being are influenced not just by the formal health care system, but also by the broader social environment. Children grow up in an ever-widening environment of family, peers, school, and community that influences their behavior and health. The remainder of this introduction discusses two contextual concerns--child abuse and neglect and selected risk-taking behaviors by adolescents.



Sources: Child Abuse and Neglect Report, 1992, 1993 and 1994, Bureau for Children, Youth and Families, Wisconsin Department of Health and Family Services, Table 1.

A. CHILD ABUSE AND NEGLECT

Over the last two years, a small decline in the rate of reported abuse cases has occurred. The overall rate has gone from 36.6 per thousand children in 1993 to 35.4 per thousand children in 1994.[4] The substantiation rate per 1000 children (the rate reflecting cases in which the child has been determined to be in need of protective intervention or services) dropped from 14.3 in 1993 to 13.5 in 1994. There were 47,561 reports of child abuse and neglect in 1994. 18,196 reports were substantiated. Neglect remains the largest category (48%) of all reports received and increased 4 percent from 1993 to 1994. Females are identified as the perpetrator of neglect in 78 percent of the cases.

Map 8 shows large variation in substantiation rates among counties, ranging from 2.5 cases per 1000 children in Vernon County to 105.4 cases per 1000 children in Menominee County. These variations may represent, in addition to the actual incidence of abuse and neglect, differences among counties in public awareness, staff effectiveness, and reporting practices.

B. RISK-TAKING BEHAVIOR AMONG ADOLESCENTS

Child behavior increasingly influences health status during adolescence. The standard way of learning about behavior is to ask individuals through a survey. The U.S. Centers for Disease Control (CDC) have organized surveys of adolescent risk-taking behavior in most states, including Wisconsin. The last Youth Risk Behavior Survey in Wisconsin with an adequate response rate was administered in 1993. This survey was conducted primarily among students in grades 9 through 12, although sixth and eighth graders were also asked the questions on drug use. As with the Family Health Survey, the results are valid only for the state as a whole, and not for individual counties or school districts. The state survey asked a total of 99 questions about injuries, drug and tobacco use, sexual behavior, dietary patterns, and physical activities.

Injuries

Survey questions covered intentional and unintentional injuries involving vehicles, weapons, physical aggression, and suicide.

Fewer than 50 percent of students used seatbelts.

Only 1 in 100 students consistently wore a bicycle helmet.

Nine percent of Wisconsin students carried weapons (such as a gun, knife or club) to school (compared to a national average in 1991 of 26 percent).

Sixteen percent of male students reported carrying guns at some time (compared to a national average in 1991 of 12 percent).

More than 1 out of 4 students (27percent) reported having considered suicide; 1 in 5 (22 percent) reported that they had planned a suicide attempt; 1 in 10 actually attempted suicide.

FIGURE 2

A Year to Year Comparison: Percent of Students Using Tobacco

21

Tobacco, Alcohol, and Other Drugs

The survey questions on tobacco, alcohol, and other drugs addressed attitudes and behaviors regarding usage; home, school, and other environmental factors; and the role of drugs in other activities involving risk, such as driving and sexual intercourse.

Seven out of 10 Wisconsin students reported some cigarette use in their lifetime; 3 of 10 reported having smoked during the past 30 days. Of students who smoked a cigarette at least once in their lifetime, the majority reported having started before the age of 14. As Figure 2 shows, smoking among adolescents has increased over the years 1989, 1991, and 1993.

Of the students who said they drank alcohol, 2 of 3 had their first drink before age 15.

More than 90 percent of high school students had an alcoholic drink in their lifetime. Half of those who reported drinking said they had consumed an alcoholic drink in the last 30 days.

One-third of the students responding to the study qualified as "binge" drinkers, defined as consuming five or more drinks in a row in the last 30 days.

Fifteen percent of high school students (and 25 percent of the seniors) reported having driven a vehicle one or more times after drinking in the last 30 days.

One of 10 students reported marijuana use in the last 30 days. Fewer than 3 of 100 reported using cocaine in the last 30 days.

Fourteen percent of students who reported using drugs used an illicit drug other than marijuana or cocaine, such as steroids.

Figures 3 and 4 show trends in alcohol and other drug use between 1989 and 1993.

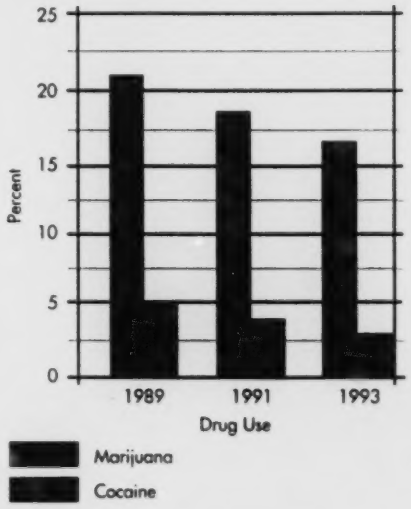
FIGURE 4

A Year to Year Comparison: Percent of Students Using Other Drugs



Source: Wisconsin Department of Public Instruction, "Wisconsin Youth Risk Behavior Survey," 1993, p. 20

Sexual Behaviors

The Wisconsin survey contained eleven questions on sexual behaviors, covering issues such as sexual intercourse, AIDS/HIV, other sexually transmitted diseases, unintended pregnancies, and forced sexual activity.

One out of 2 high school students reported having had sexual intercourse at least once.

Fifty-eight percent reported using a condom during their last intercourse and 22 percent reported using birth control pills.

Thirteen percent reported having been verbally or physically forced to take part in sexual activity.

Five percent reported that they had been pregnant or gotten someone pregnant at least once.

Seven percent (12 percent of boys and 3 percent of girls) reported having had sexual intercourse before age 13. Figure 5 offers more detail on the children whose first intercourse was before age 13.

Dietary Patterns

The Wisconsin survey asked questions concerning recent food consumption, weight loss efforts, and weight satisfaction.

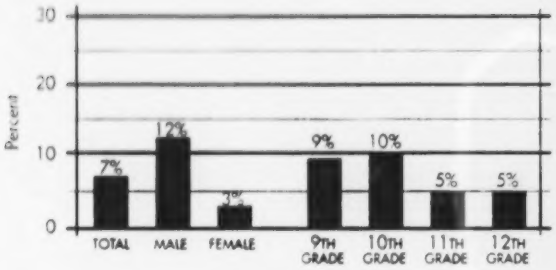
Forty-nine percent of female students and 22 percent of male students considered themselves overweight.

Forty-three percent of all high school students reported that they were trying to lose weight.

Fifty-three percent reported having eaten a high-fat food the previous day. 36 percent reported that they had eaten no fruit, 72 percent had eaten no green salad, and 55 percent reported having eaten no cooked vegetables on the previous day.

FIGURE 5

Students Who Had Intercourse Prior to Age 13



Source: Wisconsin Department of Public Instruction, Wisconsin Youth Risk Behavior Survey, 1993, p. 22

Physical Activity

Survey questions addressed the type, frequency, and duration of physical activity over the past seven days and twelve months.

Fifteen percent of high school students reported that they had engaged in no aerobic exercise in the last year, and 27 percent reported no stretching exercises and 29 percent no strengthening and toning exercises in the last 12 months.

Among those who reported exercise, most said they received their exercise by participating in physical education classes (68 percent) and school sport teams (56 percent).

Exercise and participation in physical education classes declined as students advanced through high school. A total of 80 percent of responding male and female ninth graders attended a physical education class; the comparable figures for twelfth graders were 20 percent among females and 50 percent among males.

Wisconsin has 72 counties with an estimated total population of 5,161,581. This is an increase of 4.29% over the 1990 level of 4,891,769. In fact, since 1990, the state has exceeded the population gain experienced during the decade of the 1980's. Natural increase accounts for 62% of Wisconsin's population gain while net immigration accounts for the remaining 38%. Wisconsin's growth during the 1990's has been concentrated in four regions: the Fox Valley area along the Wisconsin River, Dane County and Southeastern Wisconsin. Net immigration resulted in an additional 81,000 persons in Wisconsin between April 1, 1990 and January 1995. Dane (13,000) and Waukesha (16,000) Counties had the largest numbers of net immigrants. Ten counties experienced net outmigration between 1990 and 1995. Milwaukee County had the largest net outmigration of 28,000 residents. Wisconsin's child population (17 years and younger) increased from 1,288,972 in 1990 to an estimated 1,345,262 in 1995, a growth of 4.37%.

Of Wisconsin's 72 counties, Adams County has the 56th largest population. The county contained an estimated 19,776 people in 1995, an increase of 7.2% over the 1990 level of 18,454. This was the 4th fastest growth rate in the state during the 1990-95 period. The county seat is Friendship. The town of Rome is Adams County's largest municipality, with an estimated 1995 population of 7,051. Rome has also been the county's fastest growing municipality in the 1990s, increasing in population by 22.5% between 1990 and 1995. The county's estimated child population of 4,528 in 1995 represented 0.3% of all children in the state.

Of Wisconsin's 72 counties, Ashland County has the 57th largest population. The county contained an estimated 16,615 people in 1995, a decrease of 1.9% over the population of 16,937 in 1987. This was the fifth fastest growth rate in the state during the 8-year period. The county seat is the City of Ashland, which is also Ashland County's largest municipality, with an estimated 1995 population of 8,808.* The county's fastest growing municipality in the 1990s has been the Town of La Pointe, which grew 10.9% between 1990 and 1995. The county's estimated child population of 4,508 in 1995 represented 0.3% of all children in the state.

DATA EXPLANATIONS AND SOURCES

COUNTY POPULATION

Total Population: Population data are estimates from Official Population Estimates for 1994, Wisconsin Department of Administration, Demographic Services Center, October 1994.

Total Number of Males and Total Number of Females: Data are from Public Health Profiles - Wisconsin, 1994, Center for Health Statistics, Division of Health, Wisconsin Department of Health and Family Services. Population by sex is estimated for July 1, 1994. Estimates are rounded to the nearest ten.

Children Below Age 18: Estimates are from Public Health Profiles - Wisconsin, 1994, Center for Health Statistics, Division of Health, Wisconsin Department of Health and Family Services. Population by age is estimated for July 1, 1994. The estimates apply the percentage of the population in each county under the age of 18 in the 1990 census to the estimated total population for the county in 1994. Estimates are rounded to the nearest ten.

% of Population Below 18 and over 65: Percentages are from Public Health Profiles - Wisconsin, 1994, Center for Health Statistics, Division of Health, Wisconsin Department of Health and Family Services. Population by age is estimated for July 1, 1994. Estimates are rounded to the nearest ten.

Population Density (people per square mile): Density data are derived from Public Health Profiles - Wisconsin, 1994, Center for Health Statistics, Division of Health, Wisconsin Department of Health and Family Services.

BIRTH DATA (% OF ALL LIVE BIRTHS)

Births to Single Mothers: Marital status of the mother is noted on Wisconsin birth certificates. Live birth data are from Maternal and Child Health - Wisconsin Statistics, 1992, Maternal and Child Health - Wisconsin Statistics, 1993, Maternal and Child Health - Wisconsin Statistics, 1994, Center for Health Statistics, Division of Health, Wisconsin Department of Health and Family Services, Table 2.7.2.

Births to Mothers Under Age 18: Age of the mother is noted on Wisconsin birth certificates. Data are from Maternal and Child Health - Wisconsin Statistics, 1992, Maternal and Child Health - Wisconsin Statistics, 1993, Maternal and Child Health - Wisconsin Statistics, 1994, Center for Health Statistics, Division of Health, Wisconsin Department of Health and Family Services, Table 2.7.1.

Births to Mother With Less Than a High School Education: Education of the mother is noted on Wisconsin birth certificates. Data are from Public Health Profiles - Wisconsin, 1992, Public Health Profiles - Wisconsin, 1993, Public Health Profiles - Wisconsin, 1994, Center for Health Statistics, Division of Health, Wisconsin Department of Health and Family Services.

Prenatal Care Initiated in First Trimester of Pregnancy and ***Prenatal Care Initiated in Third Trimester of Pregnancy or No Prenatal Care:*** Data are from Maternal and Child Health - Wisconsin Statistics, 1992, Maternal and Child Health - Wisconsin Statistics, 1993, Maternal and Child Health - Wisconsin Statistics, 1994, Center for Health Statistics, Division of Health, Wisconsin Department of Health and Family Services, Table 2.7.2.

MISCELLANEOUS COUNTY DATA

Unemployment Rate: Data are from Public Health Profiles - Wisconsin, 1992, Public Health Profiles - Wisconsin, 1993, Public Health Profiles - Wisconsin, 1994, Center for Health Statistics, Division of Health, Wisconsin Department of Health and Family Services. Additional data were provided by the Wisconsin Department of Industry, Labor and Human Relations, 1996.

AFDC Cases per 1,000 Residents: AFDC caseload data are based on monthly average counts of AFDC-Regular and AFDC-Unemployed cases for each calendar year. Data are from unpublished reports provided by Bureau of Welfare Initiatives, Wisconsin Department of Health and Family Services, 1996. Rates were developed using the estimated population for each year.

Juvenile Arrests Per 1,000 Children: Arrest data are from Crime and Arrests, 1992, Crime and Arrests, 1993, Crime and Arrests, 1994, Crime and Arrests, 1995, Statistical Analysis Center, Wisconsin Office of Justice Assistance, Table 6. Rates were developed using the estimated child population for each year.

Violent Juvenile Arrests per 1,000 Children: Data on violent juvenile arrests are from Crime and Arrests, 1992, Crime and Arrests, 1993, Crime and Arrests, 1994 and Crime and Arrests, 1995, Statistical Analysis Center, Wisconsin Office of Justice Assistance, Table 6. Figures include reported data for murder, negligent manslaughter, forcible rape, robbery and aggravated assault. Rates were developed using the estimated child population for each year.

Licensed Child Care Slots Per 1,000 Children: Licensed child care slots include those in group child care and family child care settings licensed by the State. These data are from unpublished reports provided by the Wisconsin Department of Health & Family Services, Bureau of Regulation & Licensing. Rates were developed using the estimated child population for each year.

Foster, Group Home & Residential Placements per 1,000 children: Data include county residents below the age of 18 placed in foster homes, group homes, and child caring institutions/residential treatment centers. Data are from studies conducted by Professor Mark Courtney, University of Wisconsin - Madison, School of Social Work. Rates of placement were developed using the estimated child population for each year.

Child Abuse and Neglect Reports per 1,000 children and ***Child Abuse and Neglect Substantiations per 1,000 children:*** Data are from the Child Abuse and Neglect Report 1992, Child Abuse and Neglect Report 1993, Child Abuse and Neglect Report 1994, Bureau for Children, Youth, and Families, Wisconsin Department of Health and Family Services, Table 1. Rates were developed using the estimated child population for each year.

Disabled Child Supplemental Security Income Cases per 1,000 children: Rates are based on point-in-time counts of child SSI recipients as of June 30 of each year. Figures reflect the effect of a 1991 U.S. Supreme Court decision that made childhood disability conditions more likely to meet SSI disability standards. Figures also reflect the number of low-income children in each county as well as the number of disabled children, because children must meet both income and disability requirements to qualify for SSI. Rates were developed using the estimated child population for each year.

PUBLIC SCHOOL DATA

Unless otherwise specified, all of these data are from unpublished School Performance Report data, Department of Public Instruction, Bureau for Information Management, 1994-1995.

Third Grade Reading Test: Student results are reported in three categories: below standard, inconclusive, and above standard. Shown is the percentage of students who took the test, and of those who took the test, the percentage who scored "below standard."

Eighth Grade Achievement Test: Shown is the Average Grand Composite Score (AGCS), which includes all subject matter multiple choice tests and essay and short answer responses. The maximum possible number of points is 246. Only students who completed all the tests are shown in the percentage tested, and only their scores are included in the AGCS. The results are from Average Grand Composite Score

BEST COPY AVAILABLE

Results for Wisconsin Districts and Schools within Districts: 1994-1995. Eighth Grade Knowledge and Concepts Examination. Bureau for Student Assessment. Wisconsin Department of Public Instruction.

Tenth Grade Achievement Test: Shown is the Average Grand Composite Score (AGCS), which includes all subject matter multiple choice tests and essay and short answer responses. The maximum possible number of points is 246. Only students who completed all the tests are shown in the percentage tested, and only their scores are included in the AGCS. The results are from Average Grand Composite Score Results for Wisconsin Districts and Schools within Districts: 1994-1995. Tenth Grade Knowledge and Concepts Examination. Bureau for Student Assessment. Wisconsin Department of Public Instruction.

Attendance Rate: Enrollment data are as of the third Friday in September 1994.

Dropout Rate: Dropouts are less than age 19 and not attending school, do not have an excused absence, have not graduated from high school or completed a district-approved educational program, and are not known to have transferred to another school. Dropout rates are the number of students in this category divided by the official 1994-1995 school year enrollment in grades 9 through 12.

Suspension Rate: This rate is the number of students ever suspended during the year divided by the official 1994-1995 school year enrollment in grades Kindergarten through 12.

Instructional Costs Per Pupil: Costs are from unaudited school district annual reports for 1994-1995. Instructional costs consist of salaries and fringe benefits for licensed instructional staff and expenditures for services, supplies, textbooks, and equipment used for instruction purposes. Excluded are transportation costs, administrative costs, and the cost of physical plant and custodial operations, pupil services (such as school social workers, counselors & nurses) and instructional support (such as media specialists or instructional supervisors and coordinators).

Total Costs Per Pupil: Total costs include instructional costs, transportation costs, administrative costs, and the cost of physical plant and other operations, pupil services, and instructional support. They exclude only expenditures not part of a school system's general fund budget (such as those on cafeteria and debt service accounts).

HEALTH CARE RESOURCES

Unless otherwise specified these are unpublished data provided by the Office of Health Care Information, Office of the Commissioner of Insurance, State of Wisconsin, 1996.

Number of Licensed Primary Care Physicians: All physicians are required to provide a Physician Profile Survey form to the Office of Health Care Information (pursuant to INS 120.40 Wis. Adm. Code), which includes the physician's specialty. Data includes physicians reporting the following specialties: family practice (41), general practice (08), neonatology (63), obstetrics & gynecology (12), pediatrics (18), pediatrics - other (60), psychiatry - child (21), public health (22), and school physician (52). Each physician was counted only once regardless of the number of specialties indicated.

Number per 100 square miles: Population data used for this figure are estimates from the Official Population Estimates for 1993, Wisconsin Department of Administration, Demographic Services Center, October 1993. Data on land area in square miles are available from Wisconsin Legislative Reference Bureau. State of Wisconsin Blue Book 1994-1995, page 723.

Number of County Residents Per Physician: Population data used for this figure are estimates from the Official Population Estimates for 1993, Wisconsin Department of Administration, Demographic Services Center, October 1993, divided by the number of primary care physicians.

Number of Licensed Child Psychologists: All psychologists are required to provide a Psychologist Profile Survey form to the Office of Health Care Information (pursuant to INS 120.40 Wis. Adm. Code), which includes a code for specialty areas. Data show psychologists engaged in the following specialty areas: domestic violence and/or child abuse (14), family psychotherapy and counseling (19), forensic evaluations, children/adolescents (21), group psychotherapy and counseling, adolescents (25), individual psychotherapy and counseling, children/adolescents (31), and play therapy (41). Each child psychologist was counted only once regardless of the number of specialties indicated.

Number per 100 square miles:
Population data used for this figure are estimates from the Official Population Estimates for 1993, Wisconsin Department of Administration, Demographic Services Center, October 1993. Data on land area in square miles are available from Wisconsin Legislative Reference Bureau. State of Wisconsin Blue Book 1994-1995, page 723.

Number of County Residents Per Psychologist:
Population data used for this figure are estimates from the Official Population Estimates for 1993, Wisconsin Department of Administration, Demographic Services Center, October 1993, divided by the number of psychologists.

Number of Dentists in General Practice:
All dentists are required to provide a Dentist Profile Survey form to the Office of Health Care Information (pursuant to INS 120.40 Wis. Adm. Code). Data are compiled from these forms.

Number per 100 square miles:
Population data used for this figure are estimates from the Official Population Estimates for 1993, Wisconsin Department of Administration, Demographic Services Center, October 1993. Data on land area in square miles are available from Wisconsin Legislative Reference Bureau. State of Wisconsin Blue Book 1994-1995, page 723.

Number of County Residents Per Dentist:
Population data used for this figure are estimates from the Official Population Estimates for 1993, Wisconsin Department of Administration, Demographic Services Center, October 1993, divided by the number of dentists.

HOSPITALS

Number of General Hospitals:
Unpublished data provided by the Office of Health Care Information, Office of the Commissioner of Insurance, State of Wisconsin, 1996.

Number of Discharges:
Unpublished data provided by the Office of Health Care Information, Office of the Commissioner of Insurance, State of Wisconsin, 1996.

HEALTH CONDITIONS

Low Birthweight Births (% of all live births):
Defined as births in which the newborn child weighs less than 5.5 pounds (2,500 grams). Percentages are from Maternal and Child Health - Wisconsin Statistics, 1992, Maternal and Child Health - Wisconsin Statistics, 1993, Maternal and Child Health - Wisconsin Statistics, 1994, Center for Health Statistics, Wisconsin Department of Health and Family Services, Table 2.7.3.

Very Low Birthweight (% of all live births):
Defined as births in which the newborn child weighs less than 3.3 pounds (1,499 grams). Percentages are from Maternal and Child Health - Wisconsin Statistics, 1992, Maternal and Child Health - Wisconsin Statistics, 1993, Maternal and Child Health - Wisconsin Statistics, 1994, Center for Health Statistics, Wisconsin Department of Health and Family Services, Table 2.7.3.

Infant Deaths per 1,000 Live Births:
Infant deaths include all deaths, regardless of cause, to a child under age one. Data are from Maternal and Child Health - Wisconsin Statistics, 1992, Maternal and Child Health - Wisconsin Statistics, 1993, Maternal and Child Health - Wisconsin Statistics, 1994, Center for Health Statistics, Wisconsin Department of Health and Family Services, Table 3.6. Number of births (to calculate the percentage) are from the same sources, Table 2.7.3.

BEST COPY AVAILABLE

Accidental Deaths per 10,000 Children:
Includes all deaths listed on death certificates under the following International Classification of Disease (ICD) Codes E800-807, E810-825 and E826-949 (motor vehicle accidents and other accidents and adverse affects for children). Data are based on unpublished numbers from Cause of Death by Age, Table 10, 1992; Cause of Death by Age, Table 10, 1993; Cause of Death by Age, Table 10, 1994; Center for Health Statistics, Wisconsin Department of Health and Family Services. Child population figures are from the Official Population Estimates, 1992; Official Population Estimates, 1993; Official Population Estimates, 1994; Demographic Services Center, Wisconsin Department of Administration.

Suicides per 10,000 Children:
Data are unpublished numbers from the Cause of Death by Age, Table 10, 1992; Cause of Death by Age, Table 10, 1993; Cause of Death by Age, Table 10, 1994; Center for Health Statistics, Wisconsin Department of Health and Family Services. Child population figures are from the Official Population Estimates, 1992; Official Population Estimates, 1993; Official Population Estimates, 1994; Demographic Services Center, Wisconsin Department of Administration.

Rate of Elevated Lead Levels Among Children Screened:
The percent of children screened is based on reported "high" blood lead levels, defined as lead levels of 10 micrograms per deciliter or higher. The percentage of children screened derived from the reports of three public health laboratories (77.4% of the reports for 1994/95 were from these three laboratories): the Milwaukee City Health Department Laboratory, the Racine City Health Department Laboratory, and the Wisconsin State Laboratory of Hygiene. The denominator for the data is all children screened from these three sites. The numerator is the number of children with high levels from these three sites. Data are for fiscal year 1994/1995. Data source is Community Health Profiles - Children, Center for Health Statistics, Wisconsin Department of Health and Family Services, September 1996, Table 15.

Reports of Sexually Transmitted Diseases Among Children per 10,000 Children:
Sexually Transmitted Disease data include reported cases of gonorrhea, herpes, chlamydia, and syphilis. Data are from unpublished reports from Communicable Disease Section, Bureau of Public Health, Wisconsin Department of Health and Family Services, 1996.

Percentage of Children Whose Parents Divorced This Year: Filed with the Wisconsin Clerk of Courts, data is compiled and published in Vital Statistics, 1992; Vital Statistics, 1993; and Vital Statistics, 1994; Center for Health Statistics, Wisconsin Department of Health and Family Services.

Percentage of School Children Not in Compliance with Immunization Law: Data for non-compliance of the immunization law come from two sources: Public Health Profiles - Wisconsin, 1993 and unpublished 1993/1994 School Assessment Data by County; Immunization Program, Bureau of Public Health, Wisconsin Department of Health and Family Services, 1994. Equivalent compliance data was not available for 1992.

Abortions to Females Under Age 18: A reportable induced abortion is defined as "the termination of a uterine pregnancy by a physician of a woman known by the physician to be pregnant for a purpose other than to produce a live birth or to remove a dead fetus." These data are from Reported Induced Abortions in Wisconsin, 1992; Reported Induced Abortions in Wisconsin, 1993; Reported Induced Abortions in Wisconsin, 1994; Center for Health Statistics, Wisconsin Department of Health and Family Services.

HEALTH CARE SERVICES, GENERAL (PER 1,000 CHILDREN)

Number of Children Receiving WIC Services Under Age 5: Program data is reported by categories. For this report the following categories were included: Breast-fed infants 0-12 months; non-breast-fed infants 0-12 months; child age one; child age two; child age three; and child age four. These data are from unpublished reports: Wisconsin WIC Program, Annual Count of Participants by County, Report Period 10/01/92 through 9/30/93; Wisconsin WIC Program, Annual Count of Participants by County, Report Period 10/01/93 through 9/30/94; Wisconsin WIC Program, Annual Count of Participants by County, Report Period 10/01/94 through 9/30/95.

Number of Children Participating in Birth to Three Program: These are unpublished data from Birth to Three Program, Bureau of Developmental Disabilities, Wisconsin Department of Health and Family Services, 1996.

Hospitalizations by County per 1,000 Children for: Asthma, Appendectomies, Tonsillectomies, Alcohol and Other Drug Abuse and Mental Illness: These data were provided in unpublished reports by the Office of Health Care Information, Office of the Commissioner of Insurance, State of Wisconsin, 1996.

HEALTH CARE SERVICES, MEDICAID

HealthCheck Screens and Assessments, Number of Lead Tests Ages 0-20 and ***Immunizations:*** The screening and preventive service data are for children born in the year or years that more closely matches the descriptor. For example, the number of HealthCheck screens in 1994 to children under age one shows the number of HealthCheck screens in 1994 to children born in 1994. Data are from Wisconsin Medicaid Program, HMO Fee-For-Service Comparison Report, Bureau of Health Care Financing, Wisconsin Department of Health and Family Services, November 1995; Wisconsin Medicaid Program, Fee-For-Service County & Regional Data, a Supplement to the 1993-1994 HMO/Fee-For-Service Comparison Report, Bureau of Health Care Financing, Wisconsin Department of Health and Family Services, March 1996.

HEALTH CARE PAYMENT SOURCES

"Preventable" Hospitalizations per 1,000 children age 1-14 (1990-1994): "Preventable" hospitalizations include all hospitalizations for the 28 conditions that have been defined as "ambulatory-care-sensitive." The ICD-9-CM codes for these conditions are as follows: Congenital syphilis (090); Immunization preventable conditions (033, 390, 391, 037, 045, 320.0; Grand mal status and other epileptic convulsions (345); Convulsions "A" (780.3 ages 0-5); Convulsions "B" (780.3 ages 5 >); Severe ear, nose, and throat infections (382, 462, 463, 465, 472.1); Pulmonary tuberculosis (011); Other tuberculosis (012-018); Chronic obstructive pulmonary disease (491, 492, 494, 496, 466.0); Bacterial pneumonia (481, 482.2, 482.3, 482.9, 483, 485, 486); Asthma (493); Congestive heart failure (428, 402.01, 402.11, 402.91, 518.4); Hypertension (401.0, 401.9, 402.00, 402.10, 402.90); Angina (411.1, 411.8, 413); Cellulitis (681-683, 686); Skin grafts with cellulitis (DRG 263 and 264); Diabetes A (250.1, 250.2, 250.3); Diabetes B (250.8, 250.9); Diabetes C (250.0); Hypoglycemia (251.2); Gastroenteritis (558.9); Kidney/urinary infection (590, 599.0, 599.9); Dehydration-volume depletion (276.5); Iron deficiency anemia - ages 0-5 only (280.1, 280.8, 280.9); Nutritional deficiencies (260-262, 268.0, 268.1); Failure to thrive - ages < 1 only (783.4); Pelvic inflammatory disease (614); Dental conditions (521-523, 525, 528). Denominators for calculating average age-specific hospitalization rates for the five year period 1990-1994 were obtained by averaging the number of children in the population in 1990 and in 1994. Wisconsin Community Health Profiles - Children, Center for Health Statistics, Wisconsin Department of Health and Family Services, September 1996, Table 9.

% of 1995 Juvenile Admissions to Hospitals Funded Primarily by:
Medicaid, Commercial insurance, Other government, No third party or self-pay, other and unknown: These data are the "expected" payment source at the time of admission. The actual payment source after services are provided may be different. These are unpublished data provided by the Office of Health Care Information, Office of the Commissioner of Insurance, State of Wisconsin, 1996.

1994 Medicaid Share of Health Care Coverage for Children Born in 1993: The numerator is the actual number of months of Medicaid participation by county in 1994 for children born in 1993. These numbers are from unpublished data provided by the Wisconsin Bureau of Health Care Financing, October 24, 1996. The denominator is births by county in 1993 times 12 (to reflect all potential months of Medicaid eligibility in 1994 for children born in 1993). The birth data are from Maternal and Child Health Statistics - Wisconsin 1993, Center for Health Statistics, Wisconsin Department of Health and Family Services, Table 2.7.3. The data will be more accurate in counties with low in-migration or out-migration among low-income residents with infants, or in which such in- and out- migration are approximately equal.
